RTR Appendix

Southern California Gas Company (SoCalGas) developed Responses to Recommendations (RTR) contained in the evaluation studies of the 2013-2015 Energy Efficiency Program Cycle and beyond. This Appendix contains the Responses to Recommendations in the report:

RTR for the Forward-looking Smart Thermostat Study Impact Evaluation (DNV, Calmac ID #CPU0367.01)

The RTR reports demonstrate SoCalGas' plans and activities to incorporate EM&V evaluation recommendations into programs to improve performance and operations, where applicable. SoCalGas' approach is consistent with the CPUC Decision (D.) 07-09-043¹ and the Energy Division-Investor Owned Utility Energy Efficiency Evaluation, Measurement and Verification (EM&V) Plan² for 2013 and beyond.

Individual RTR reports consist of a spreadsheet for each evaluation study. Recommendations were copied verbatim from each evaluation's "Recommendations" section.³ In cases where reports do not contain a section for recommendations, the SoCalGas attempted to identify recommendations contained within the evaluation. Responses to the recommendations were made on a statewide basis when possible, and when that was not appropriate (e.g., due to utility-specific recommendations), SoCalGas responded individually and clearly indicated the authorship of the response.

The Joint IOUs are proud of this opportunity to publicly demonstrate how programs are taking advantage of evaluation recommendations, while providing transparency to stakeholders on the "positive feedback loop" between program design, implementation, and evaluation. This feedback loop can also provide guidance to the evaluation community on the types and structure of recommendations that are most relevant and helpful to program managers. The Joint IOUs believe this feedback will help improve both programs and future evaluation reports.

Attachment 7, page 4, "Within 60 days of public release, program administrators will respond in writing to the final report findings and recommendations indicating what action, if any, will be taken as a result of study findings as they relate to potential changes to the programs. Energy Division can choose to extend the 60 day limit if the administrator presents a compelling case that more time is needed and the delay will not cause any problems in the implementation schedule, and may shorten the time on a case-by-case basis if necessary to avoid delays in the schedule."

Page 336, "Within 60 days of public release of a final report, the program administrators will respond in writing to the final report findings and recommendations indicating what action, if any, will be taken as a result of study findings. The IOU responses will be posted on the public document website." The Plan is available at http://www.energydataweb.com/cpuc.

Recommendations may have also been made to the CPUC, the CEC, and evaluators. Responses to these recommendations will be made by Energy Division at a later time and posted separately.

Response to Recommendations (RTR) in Impact, Process, and Market Assessment Studies

| | | | | If incorrect, please indicate and redirect in notes | Choose: Accepted, Re- jected, or Other | Examples: Describe specific program change, give reason for rejection, or indicate that it's under further review. | Next Steps: For each accepted recommendation, out- line the steps required for implementa- tion, responsible parties, and deadlines. For each rejected recommendation, doc- ument the reason provided for rejection. Outline any potential follow-up actions or considerations for the future. | Timeline: Set deadlines for the completion of each action. In- clude a start date and end date when possible. |
| 1 | 40 | Our analysis indicates that the proportion of vulnerable custom- ers (DAC, HTR, and non-metro area customers) receiving smart thermostats via direct install pro- grams has increased significantly from PY2018 through PY2021, even as the participation of cus- tomers from these segments in smart thermostat rebate pro- grams has remained flat. Partici- pation of multifamily customers in direct install programs has also been significantly high at 57% over this period. These findings indicate improved targeting of these populations. | Direct install programs should continue serving the state's vul- nerable customers, given this customer segment's limited re- sources to take advantage of re- bate programs' EE offerings. Di- rect install programs should also continue serving the multifamily sector, which makes up one- third of the state's residential population since this is the pri- mary channel for multifamily households to access IOU EE program offerings. | | Accepted | SoCalGas has multiple programs aimed at Direct Installation of technologies to underserved (HTR/DAC) customers. | SoCalGas currently administers four DI programs serving DAC/HTR. The pro- grams will run until 2027. | |
| 2 | 40 | Top-quartile energy consumption rebate program participants achieved significant higher elec- tric and gas savings than custom- ers in lower energy consumption quartiles, at 151 versus 3 kWh per household and 12 versus -6 therms per household, respec- tively. | Smart thermostat savings may be improved by factoring in household energy consumption levels in program targeting. Re- bate programs should consider using the level of energy con- sumption as a key targeting vari- able. | | Other | SoCalGas provides rebates for smart thermostats through the SoCalGas Mar- ketplace program. SoCalGas will evalu- ate whether the program is capable of conducting consumption-based target- ing. | | |
| 3 | 40 | The single consistent modeling approach we used in the study | When feasible, evaluations should identify and correct for | | Other | This recommendation is not directed towards SoCalGas. During the next | n/a | |

| | | addresses self-selection bias identified in previous evalua- tions. Model estimates indicate that the energy consumption trends of participants and non- participants are different and sta- tistically significant. These differ- ences affect estimated electric rebate and direct install smart thermostat savings but have lim- ited effect on gas savings. When moving from a model that does not account for trend differences to one that does, rebate smart thermostat savings go from nega- tive to positive, and direct install smart thermostat savings go from positive to a small negative number. | these possible biases when esti- mating the effect of opt-in pro- grams using consumption data analysis. | | | Smart Thermostat Impact evaluation, the <i>ex post</i> team should consider this recommendation. | | |
| 4 | 41 | The evidence suggests that en- ergy savings from smart thermo- stats installed in PY2018 have in- creased over time despite the possibility that COVID-related in- creased occupancy eroded the saving potential for thermostats. DNV's new model results, pre- sented in Table 4-12, show that electric and gas savings, from both the rebate and direct install channels, are higher when esti- mated using data from all post- years compared to the first post- year, which was pre-COVID. De- vice information DNV received also indicates that average HVAC cooling runtimes decreased in 2021 compared to 2019. | Thermostat optimization could improve smart thermostat en- ergy savings performance. Addi- tional studies that track smart thermostat savings over time are needed to strengthen this finding. | | Other | The updated savings estimates from this impact evaluation were unable to be integrated into the PY2026 measure package update for smart thermostats. Measure package savings are broken out by Building type, climate zone, and HVAC type. The savings from this report were not granular enough to adopt into the measure package. If the Impact Evaluations do not provide data/results in a format that can be translated to the measure package, it presents challenges to integrate in fu- ture measure package updates. As evaluated smart thermostat savings are low and the findings of each study are varied, future impact evaluations on the technology are unnecessary. | The updated savings from this study were considered for the PY2026 measure package update but were unable to be integrated. | Completed |
| 5 | 41 | Previous smart thermostat sav- ings may have been overstated. The current panel and previous DID evaluation results indicate similar findings when neither cor- rects for trend differences (Table 4-11). However, the current model results reveal that the prior PY2018 ad hoc corrections somewhat overstated rebate electric and gas savings. They also indicate that the PY2019 electric direct install evaluation | We recommend continued eval- uation of new installations to confirm the results identified in this study. | | Rejected | Since 2020, four evaluations of smart thermostat impacts have been con- ducted, yielding varied savings esti- mates. Due to the low savings and in- consistent findings, SoCalGas does not recommend further evaluations of smart thermostats. | n/a | |

| # | # | | Recommendations (Verbatim from Final Report) | tion Recipient | | | | | |
| 6 | 41 | may have overstated savings. Both rebate and direct install non-HTR participants have elec- tric savings, while HTR and multi- family participants do not. Partic- ipants in the latter two groups likely reside in less efficient homes than non-HTR and single- family participants and experi- ence higher levels of energy dep- rivation. Customer responses from participant surveys con- ducted for DNV's impact evalua- tions of the PAs' PY2018, 2019, and 2020 rebate and direct install programs indicate a significant increase in customer comfort post smart thermostat installa- tion. While direct install program participants received multiple measures along with smart ther- mostats, such as duct sealing and HVAC motor replacement, that could have contributed to in- creased comfort, smart thermo- stats' promise to regulate and re- duce energy use and cost could have led some of these partici- pants to increase their comfort | There is higher energy consump- tion post-installation among some customer segments. Given this, we recommend improved customer education on how smart thermostats work and how they provide energy and cost savings. The PAs cannot re- quire "eco" settings on these program-provided thermostats, but they need to find a way to encourage more participants to adopt those settings | | Accepted | Providing training and education are something each of our DI implementers are required to complete. SoCalGas will continue to enforce this requirement. | SoCalGas will review the installation pro- cess with implementers to ensure cus- tomers are being informed of thermostat operations and trouble shooting. | | 3861, 3884, 3885, 3889, 3935, and 3936 |
| 7 | 42 | and use more energy. Savings estimates for installa- tions of Technology type 1 are approximately triple the savings estimates for installations of Technology type 2. Unlike direct install programs that delivered largely the same smart thermo- stat technology type to partici- pants, rebate program partici- pants purchased different smart thermostat types. Using these data, DNV estimated the electric savings of technology 1 to be 55 kWh per household and technol- ogy 2 to be 17 kWh per house- hold. Neither technology type provided statistically significant gas savings. | The savings potential of smart thermostats continues to change even after installation due to software updates. Pro- grams should factor in variations in technology and evolving algo- rithms that result in notably dif- ferent outcomes when consider- ing this measure for programs. PAs should assess savings by specific technologies periodi- cally to understand if there are differences and calibrate tech- nology/measure package rec- ommendations. | | Other | Measure packages must maintain man- ufacturer neutrality for all equipment. Energy efficiency policy does not allow for measure packages to be written for specific manufacturers of a technology. Due to the proprietary nature of the control algorithm, it is difficult to ana- lyze the difference in savings between manufacturers. Measure package savings are revisited bi-annually using the best available data. | The measure package was updated for PY2026 and will be re-evaluated for PY2028 | | |
| 8 | 42 | CPUC D. 21-12-015 (in Rulemak- ing R.20-11-003), adopted in De- cember 2021, is designed to achieve load reduction in hot cli- mate zones 9-15 and directs PAs | There are program opportuni- ties to increase smart thermo- stat penetration in households with air-conditioning in hot cli- mate zones. Programs should | | Other | This is not directed at SoCalGas. SoCal- Gas was not a party to D.21-12-015 and does not have any demand response programs as a single-fuel gas utility. This recommendation will be passed | n/a | | |

| Item | Page | Findings | Best Practice / | Recommenda- | Disposition | Disposition Notes | SCG Proposed RTR Implementation |

| # | # | | Recommendations (Verbatim from Final Report) | tion Recipient | | | |
| | | to subsidize smart thermostats for customers in these climate zones. The absolute number of smart thermostats installed cu- mulatively in these climate zones through the PAs' direct install programs from PY2018 through PY2021 is approximately 286,000. The total installed base of smart thermostats in these cli- mate zones is greater than 286,000 as it will also include those provided at low to no-cost by other energy efficiency pro- grams like Energy Savings Assis- tance (ESA) and non-program adoption of smart thermostats. Assuming a non-program smart thermostat adoption rate of 25% and a statewide average annual ESA program footprint of 260,000, the smart thermostat installed base is likely lower than the estimated 3.5 million of five million households that use air- conditioning in these specific cli- mate zones. Households with air- conditioning contribute to grid stress from increased cooling de- mand during peak periods from May through October. These households represent ideal tar- gets for energy efficiency and de- mand response programs that deploy smart thermostats. | aim to expand the penetration of smart thermostats that can be operated as part of a "fleet" that can serve as virtual power plants (VPPs) to provide direct relief to these overloaded parts of the grid. | | | along to the relevant electric utility partners. | |
| 9 | 43 | The peak load reduction poten- tial of smart thermostats makes them suitable for use in DR pro- grams. However, DR program en- rollment among smart thermo- stat program participants has been modest at 7% for rebate program participants and no more than 6% for direct install participants. | Programs delivering free or sub- sidized smart thermostats should consider automatically enrolling direct install program participants in DR programs with an opt-out option and providing information on DR programs for rebate program participants to maximize peak load savings. | | Other | SoCalGas does not have any demand response programs as a single-fuel gas utility. This recommendation will be passed along to the relevant electric utility partners. | n/a |
